

Group Project 2

Team Name : Kurkure

Changes

- The n = 4 relationship **placed** was easily broken into 3 binary relationships, thus having it as an n=4 relationship was redundant and is now broken into **placed**, **ordered to** and **paid with** all of which have no attributes and with constraints as shown in the diagram
- The n=3 relationship **reviewed** is now converted to a n=4 relationship **reviewed** to contain the order details of the product the user is reviewing
